

ITER ORGANIZATION **PROGRESS IN PICTURES 2018**

A star is born

star will soon be born, a star unlike any other ... a man-made star. ITER - the Latin word for "The Way" - will light up in the middle of the coming decade.

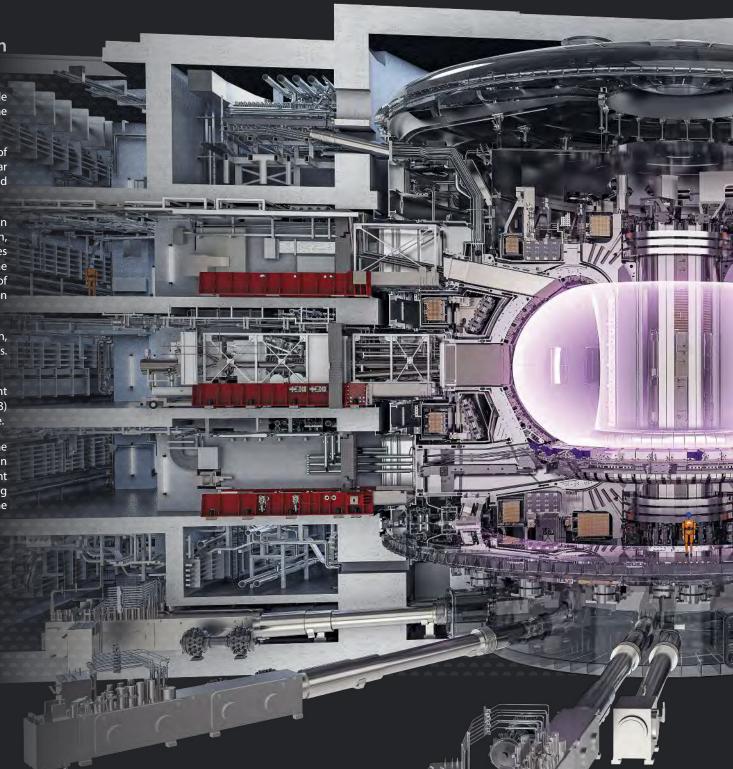

From a scientific and technological point of view, it will be one of humankind's historic achievements. The creation of an artificial star and the tapping of the tremendous amounts of energy produced could forever alter the course of civilization.

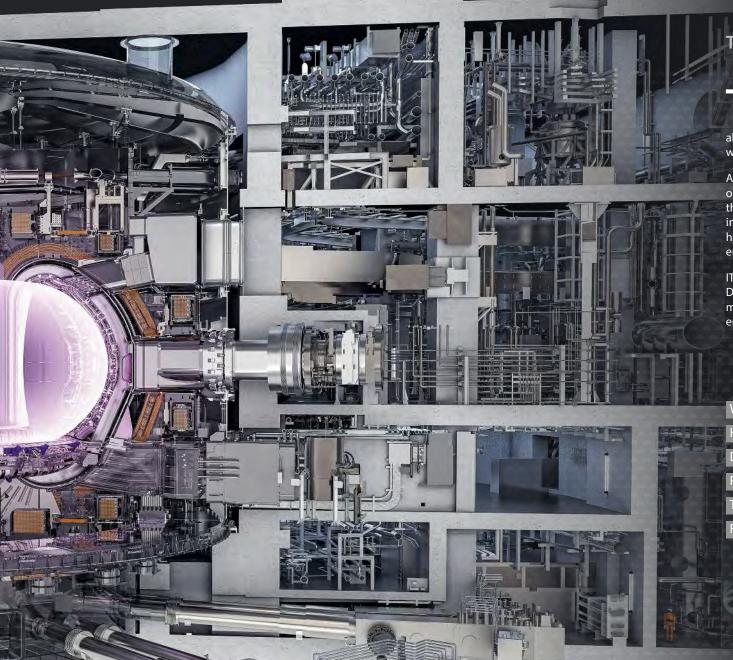

The ITER Project, an unprecedented international collaboration that brings together China, the European Union, India, Japan, Korea, Russia and the United States, is the culmination of decades of research and years of diplomatic negotiation. It has been the aspiration of three generations of physicists; it is now the reality of hundreds of scientists, engineers, and labourers involved in ITER in France and throughout the world.

The seven ITER Members, representing half the world's population, share the responsibility for building the ITER machine and facilities. Every Member, essentially, is involved in every system.

As buildings rise on the ITER platform (pages 5 to 27), component manufacturing advances in ITER Member factories (pages 33 to 53) and preparations are underway for the machine assembly phase.

This fifth edition of the ITER photobook aims to take you into the heart of ITER – from the rolling hills of Provence to factories on three continents, where men and women from 35 nations are bent on realizing one of mankind's most enduring dreams: capturing the fire of the stars and making it available to humanity for the millennia to come.

The ITER machine is a *tokamak*, the Russian acronym for Toroidal Chamber, Magnetic Coils. Tokamaks were developed in the 1960s at a time when nations were experimenting with all kinds of different systems to reproduce the nuclear reactions at work in the core of the Sun and stars.

A tokamak, like a star, is designed to fuse light atoms into heavier ones. A tokamak is a magnificent tribute to Albert Einstein's E=mc²: the tiny loss of mass that results from the fusion process translates into a huge quantity of energy. One gramme of fusion fuel (the hydrogen isotopes deuterium and tritium) generates as much energy as eight tonnes of oil.

ITER will be by far the largest and most complex tokamak ever built. Designed from the experience accumulated in hundreds of fusion machines throughout the world, it will demonstrate that fusion energy is scientifically and technologically feasible.

Weight	23,000 Tonnes
Height	~ 30 Metres
Diameter	~ 30 Metres
Plasma volume	840 M³
Temperature at plasma core	150,000,000 °C
Fusion power	500 MW

ITER Collaboration

The ITER construction platform

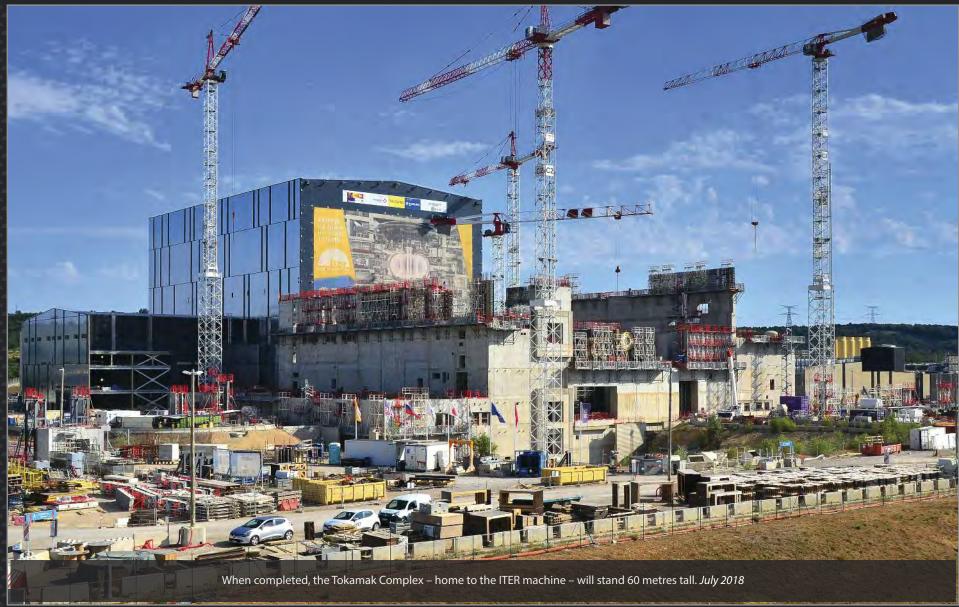

Spectacular progress

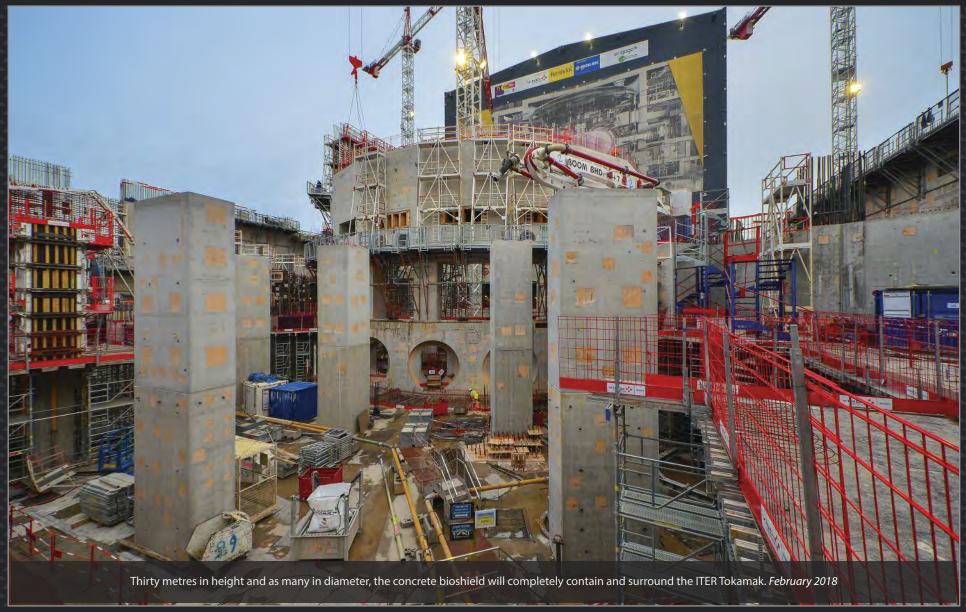

ITER jewel box

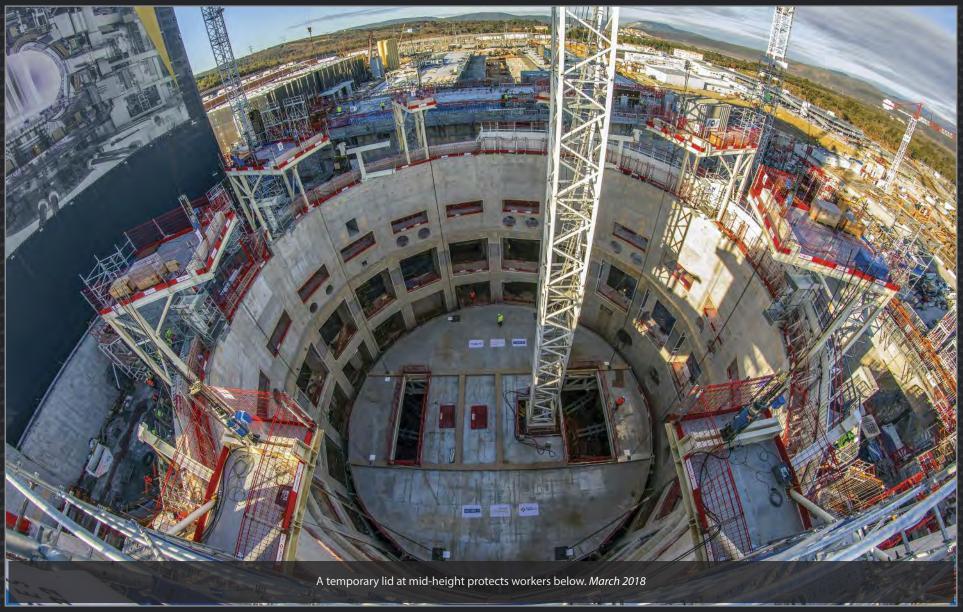

Temporary lid

Under a protective roof

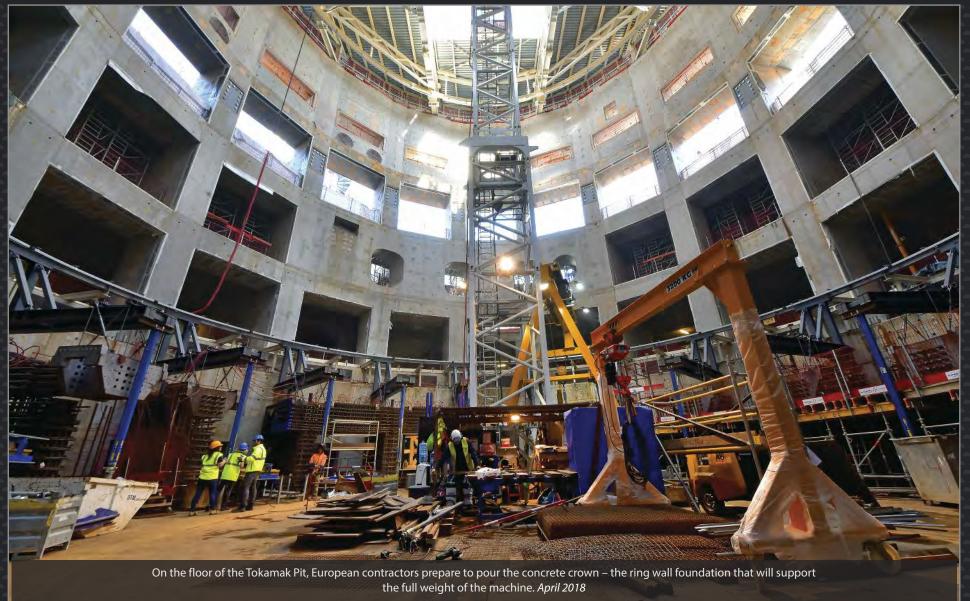

A crown under the machine

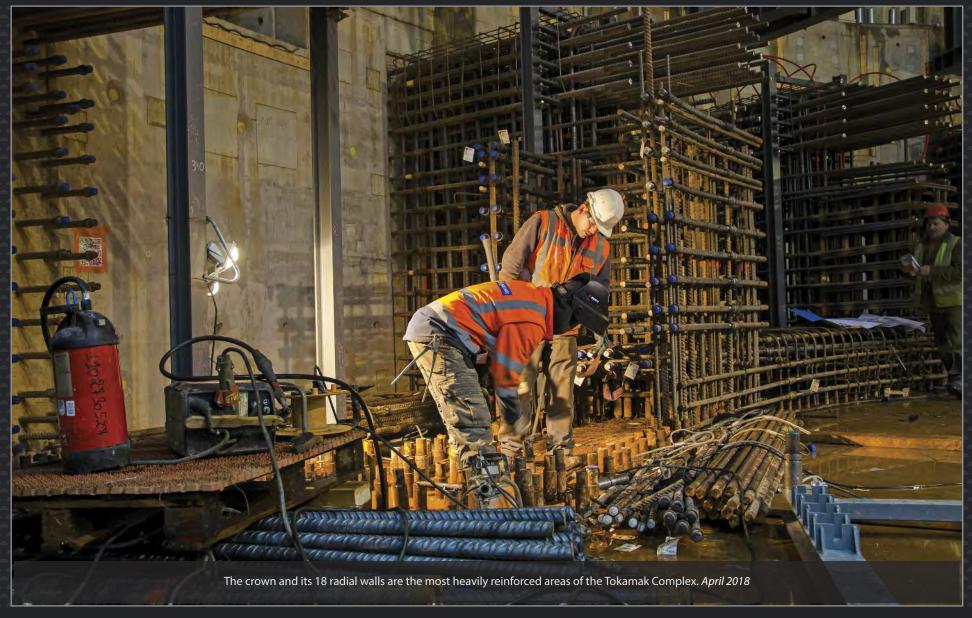

Supporting 23,000 tonnes

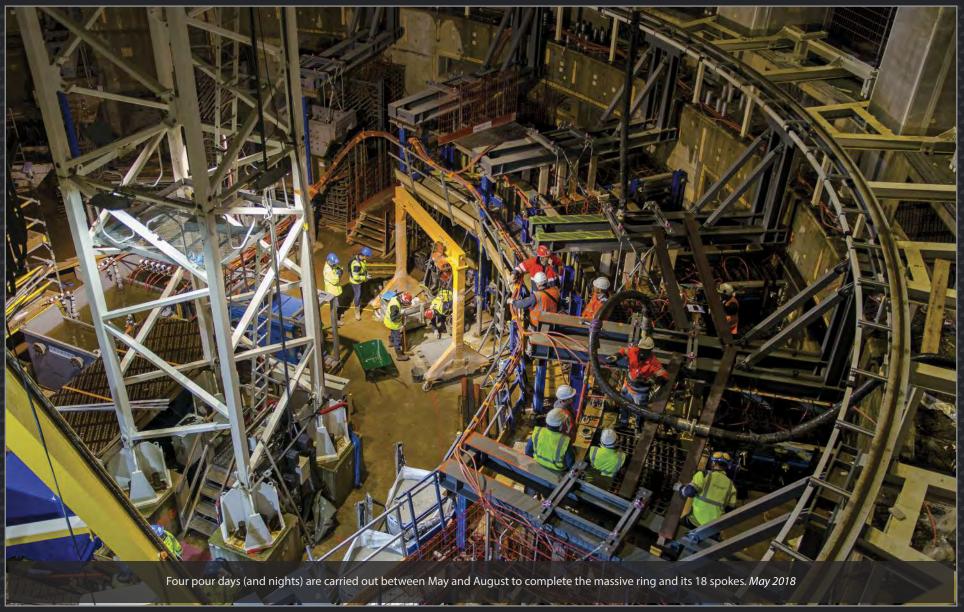

Working into the night

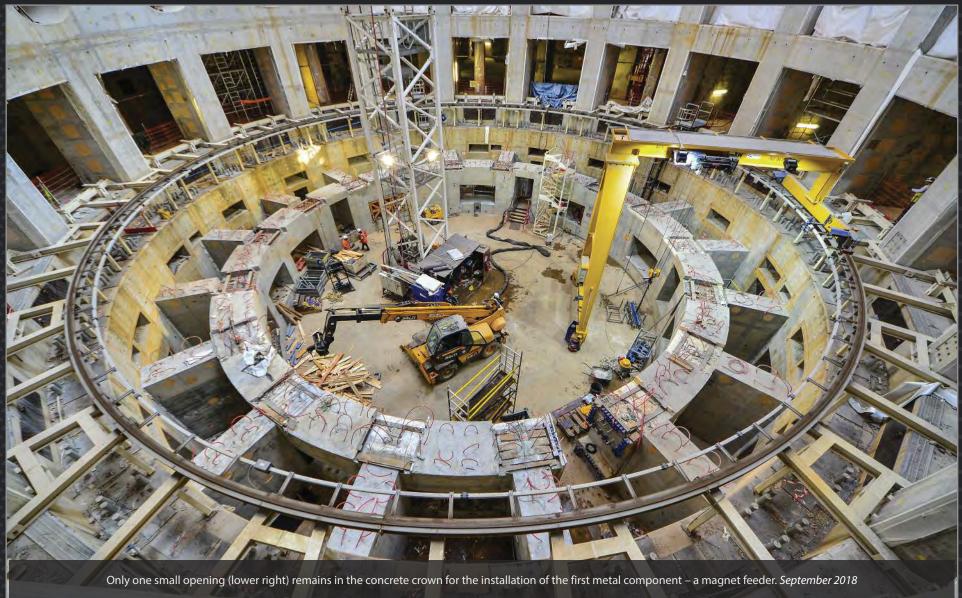

18-point crown

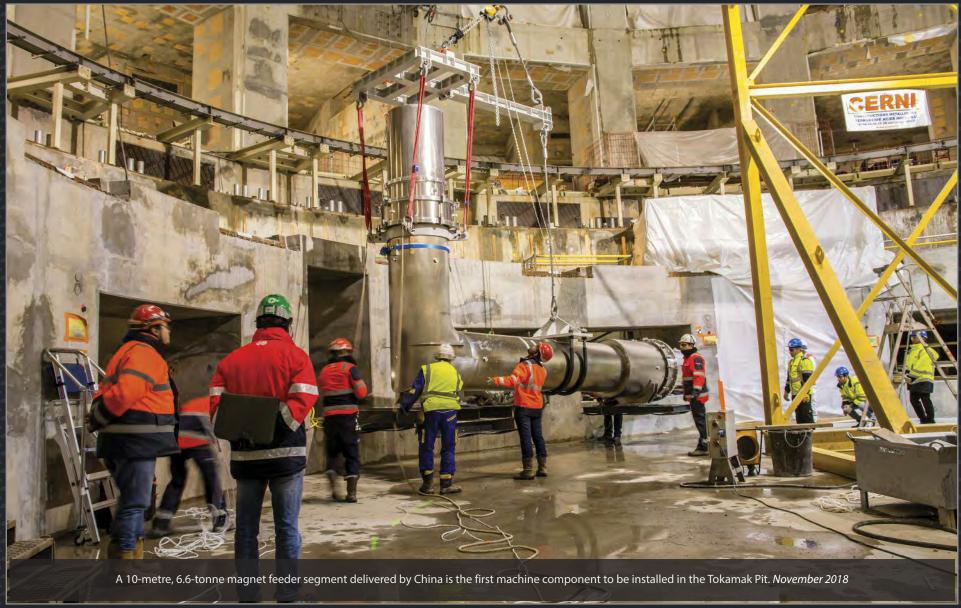

Metal joins concrete

Deep in the Tokamak Building

Looking north

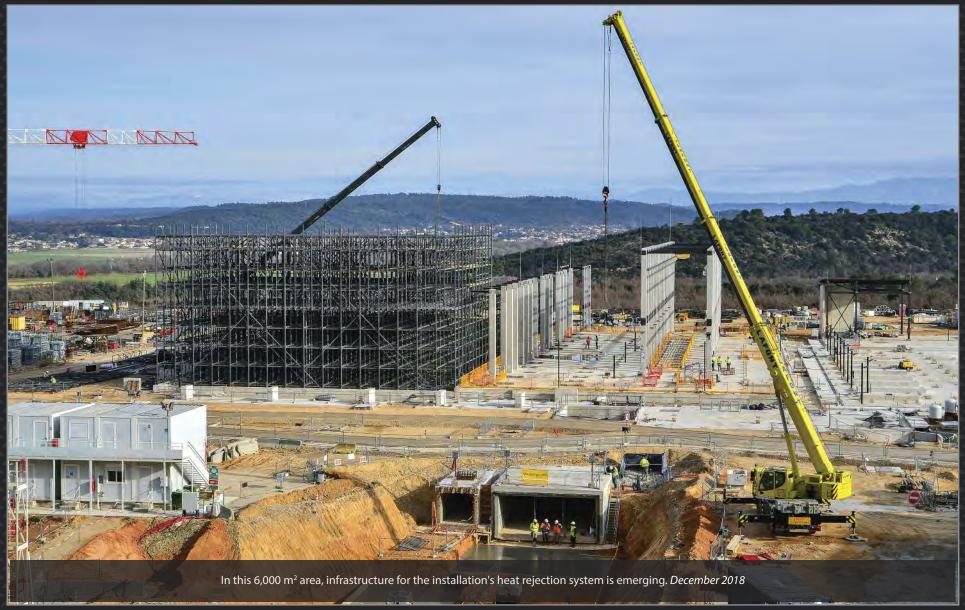

Cooling tower zone

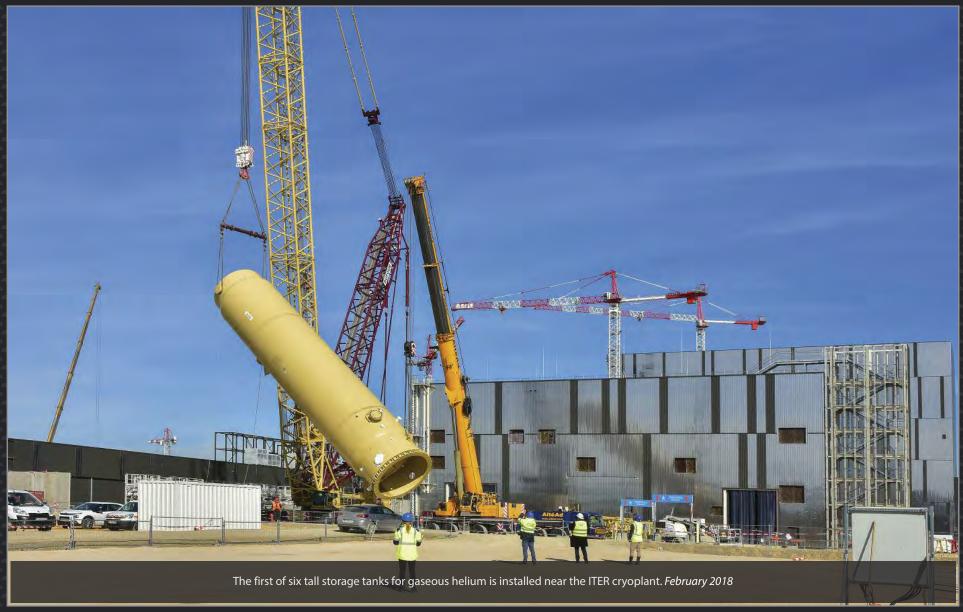

Storing helium

Powered up

Four transformers supplied by US ITER for the steady state electrical network have been "energized" and ITER is officially connected to the French grid. September 2018

The cold factory

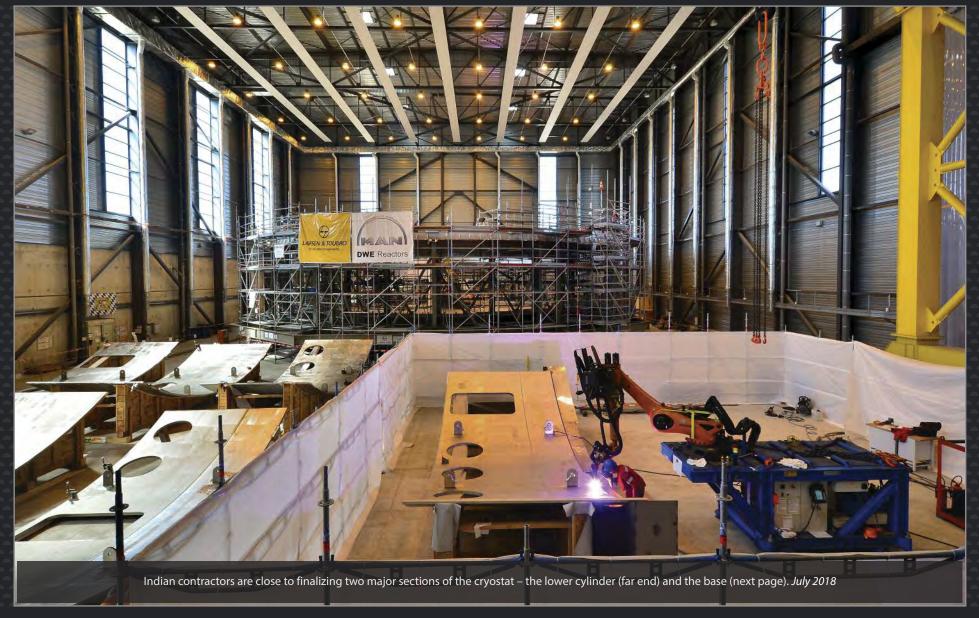

Giant thermos taking shape

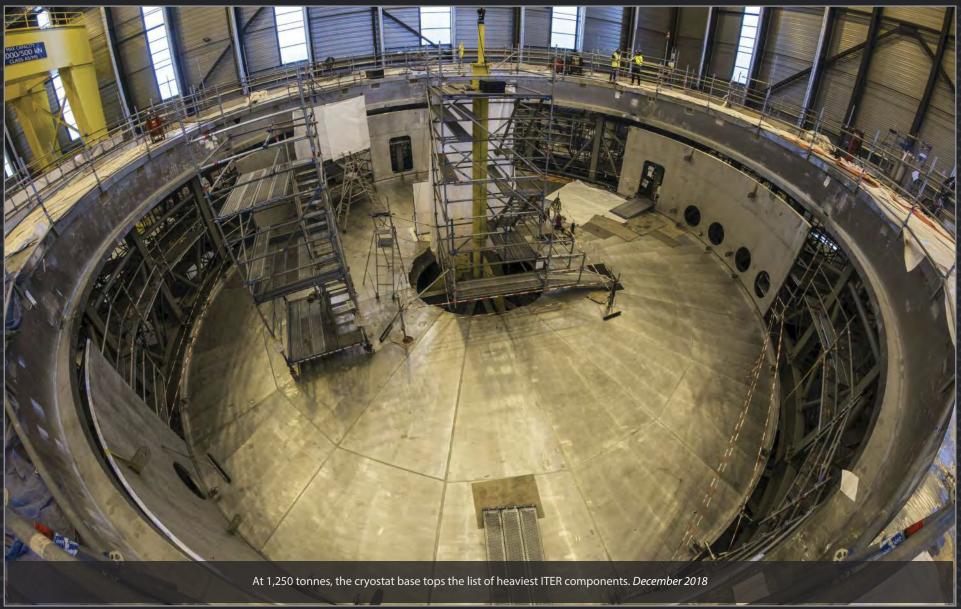

Heaviest single component

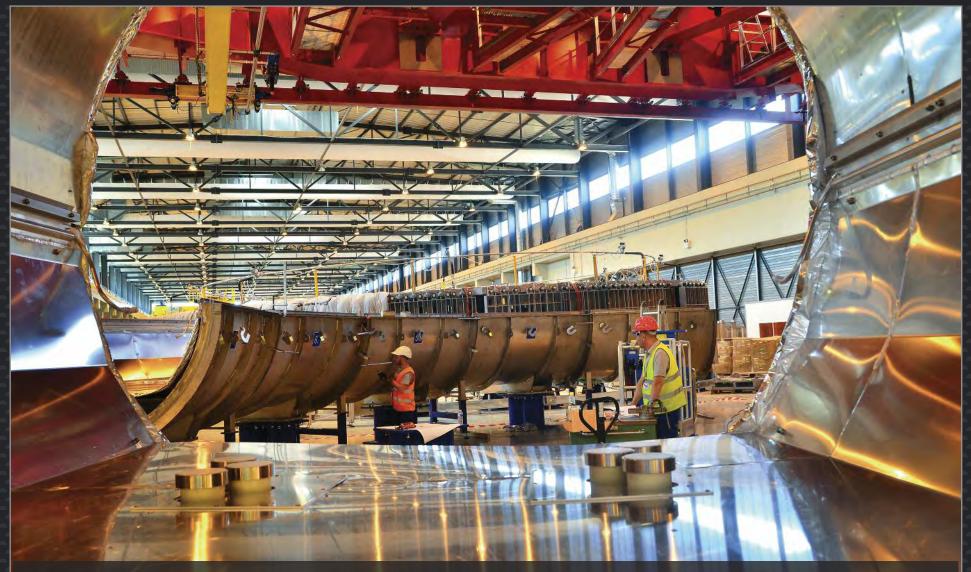

Ring magnet #5

In the Poloidal Field Coils Winding Facility on site, the first of four coils is taking shape. The final step will be cryogenic testing at -193 °C in this specialized chamber. July 2018

Twin Titans

A second vacuum vessel sector handling tool has been delivered by Korea and installed in the Assembly Hall. The twin tools will be load tested early next year. December 2018

Narrow access to a large room

Three tanks for the Tokamak cooling water system (procured by US ITER) and four tanks for the vacuum vessel's vapour suppression system (procured by the ITER Organization) have been installed in the Tokamak Building's drain tank room. *August 2018*

Now painted in white, the lowest basement level of the Diagnostic Building is ready for handover to contractors for systems installation. Embedded plates – for the attachment of system supports – are visible on all surfaces. December 2018

Deep down under

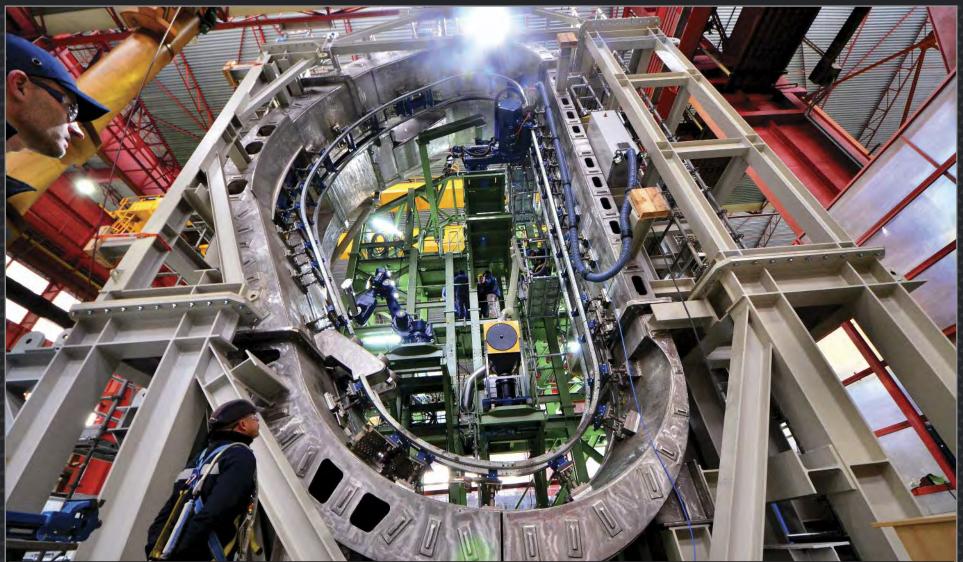

In one of the galleries deep inside the Tokamak Complex, contractors review the day's plans. More than 2,000 people are involved in ITER construction – 1,600 workers and 400 engineers and supervisors. March 2018

Rehearsing a grand production

This tall mockup reproduces a portion of the D-shaped vacuum vessel at 1:1 scale. Equipos Nucleares SA (Spain) is using it to rehearse one of the longest and most complex sequences of machine assembly – the welding of the ITER vacuum vessel and ports. November 2018

SPIDER launched

Science at the ITER Neutral Beam Test Facility in Padua, Italy, is officially launched as the SPIDER negative ion source produces its first plasma. The Domestic Agencies of Europe and India have contributed components. June 2018

ITER ORGANIZATION MANUFACTURING

unique aspect of ITER implementation is the in-kind procurement system that was established at the onset of the project. Instead of contributing purely financial resources, China, the European Union, India, Japan, Korea, Russia and the United States provide 90% of their contributions in the form of machine components, systems and – in the case of Europe – buildings.

Procurement packages are shared equally (\sim 9% of the total value) between China, India, Japan, Korea, Russia and the United States; Europe's share, as Host Member, is \sim 45%.

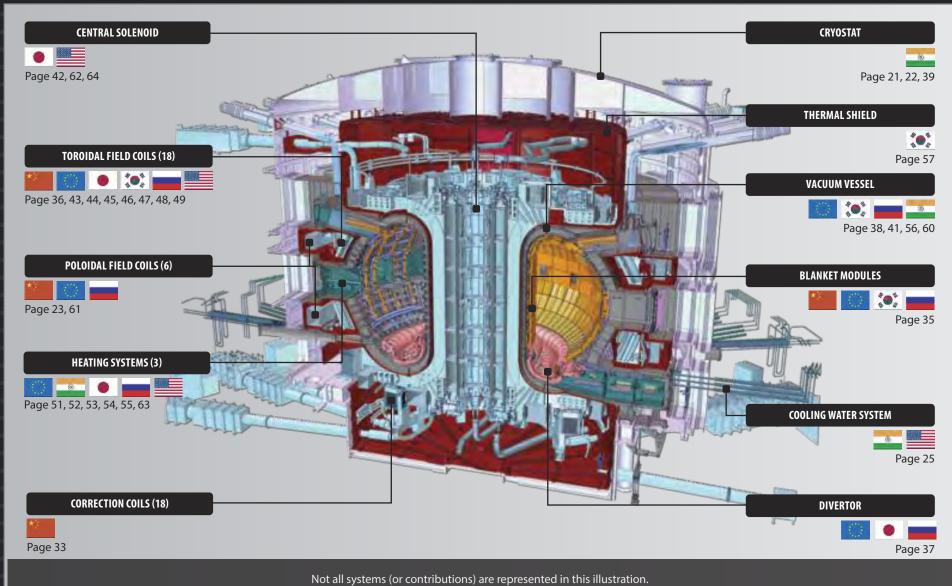

The in-kind procurement arrangement is at the core of ITER's founding philosophy, offering the ITER Members invaluable experience in the manufacturing of components for a fusion installation.

By contributing to the construction of the experimental machine, the ITER Members are creating the technological and industrial basis for the commercial fusion reactors of the future.

The project is also spurring developments in other fields, as companies apply the expertise acquired in the fabrication of ITER's cutting-edge components and systems to other applications and technologies.

Who manufactures what?

Case closed

Six bottom, six side, and six top correction coils will be installed around the Tokamak to correct field errors. At the Institute of Plasma Physics, Chinese Academy of Sciences (ASIPP), final closure welding has been carried out on the first bottom production unit.

A box for cold components

Coil termination boxes provide the thermal insulation for the cryogenic components at the very end of each magnet feeder. This production unit is about to pass factory acceptance tests at ASIPP.

Helium test passed

20 days in the cold

The first toroidal field winding pack manufactured in Europe is lowered into a specially designed cryostat for cold testing, where it will spend 20 days at minus 193 °C to confirm the robustness of coil insulation.

Trial by fire

This plasma-facing component of the ITER divertor – a full-scale prototype of the inner vertical target manufactured by Ansaldo Nucleare and ENEA – is about to be tested at the ITER Divertor Test Facility at the Efremov Institute in Russia.

Five out of nine

Fusion for Energy (F4E), the European Domestic Agency, is delivering five of ITER's nine vacuum vessel sectors. The first to come off the production line in 2020 will be Sector #5. (Pictured, a poloidal segment mounted on assembly tooling at Mangiarotti SpA.)

Nearing the end

490-tonne upper cylinder (pictured) and 665-tonne top lid.

All angles, bends and turns

Cryogenic fluids at ITER will be circulated between the cryoplant and the Tokamak Building through a complex, five-kilometre network of industrial cryolines. INOXCVA is manufacturing approximately 50% of these high-tech components at its factory in Vadodara.

Thousands of plates, thousands of shapes

In-wall shielding plates – assembled into blocks – will fill 55% of the space between the walls of the vacuum vessel to provide radiation shielding for the superconducting coils. India is procuring approximately 50,000 plates, and each one is unique in shape, size and weight.

Loading the last central solenoid conductor onto a ship to the United States

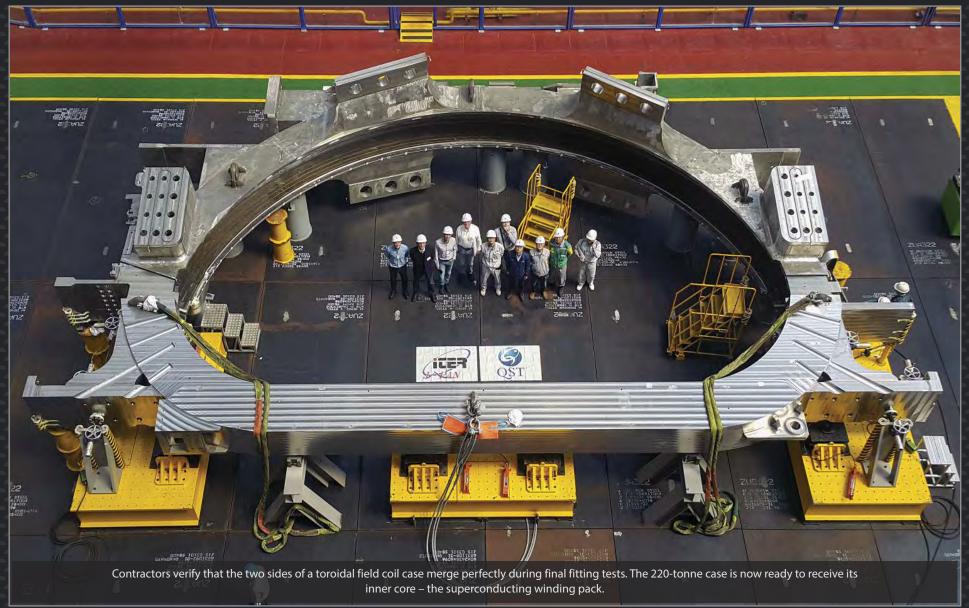

The last of 49 central solenoid conductors was loaded onto a ship to the United States. for winding at the Hibiki port in Kyushu. It will take about a month for the ship to deliver it from Japan to the United States.

Final fit

Toroidal field coil 12 winding pack in final acceptance test phase

Final acceptance tests for torroidal field coil 12 winding pack are currently underway. This involves He leak tests and a high voltage test, which are performed before and after cooling the winding pack down to 80K.

Coil cases in mass production

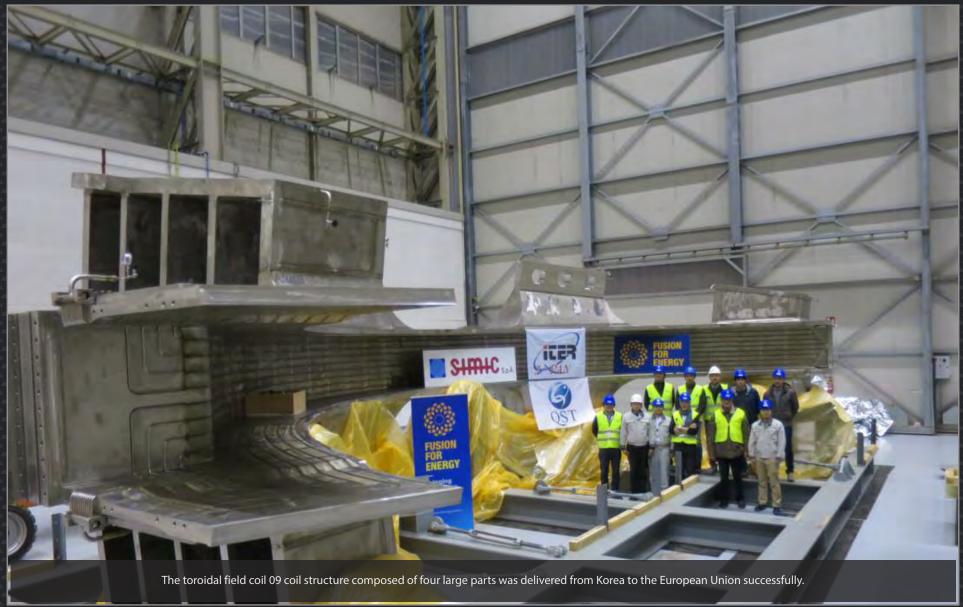

Technicians at Hyundai Heavy Industries are verifying the fit of two outboard sectors, including the closure weld bevel. Once the toroidal field winding pack is inserted into the coil case, the inner cover plates will be positioned and welded.

First toroidal field coil structure delivered to European Union factory for final assembly

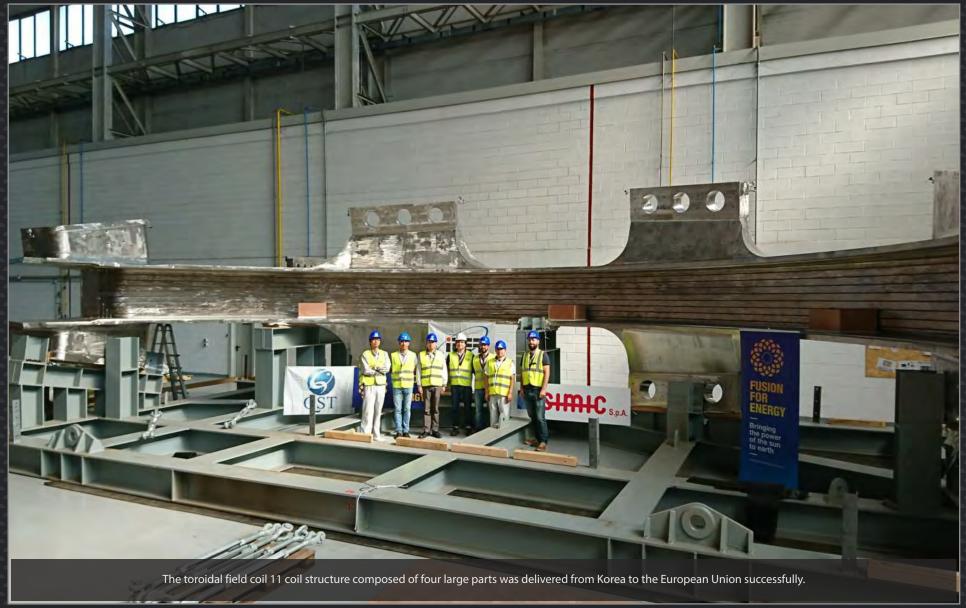

Second toroidal field coil structure delivered to European Union factory for final assembly

Completion of AU-BU fitting test for the first Japanese toroidal field coil structure

The inboard sub-assembly "AU" below and the outboard sub-assembly "BU" positioned overhead for the first toroidal field coil structure from Japan. Tolerances of less than 1 mm were achieved.

BU of the third toroidal field coil structure delivered to European Union factory for final assembly

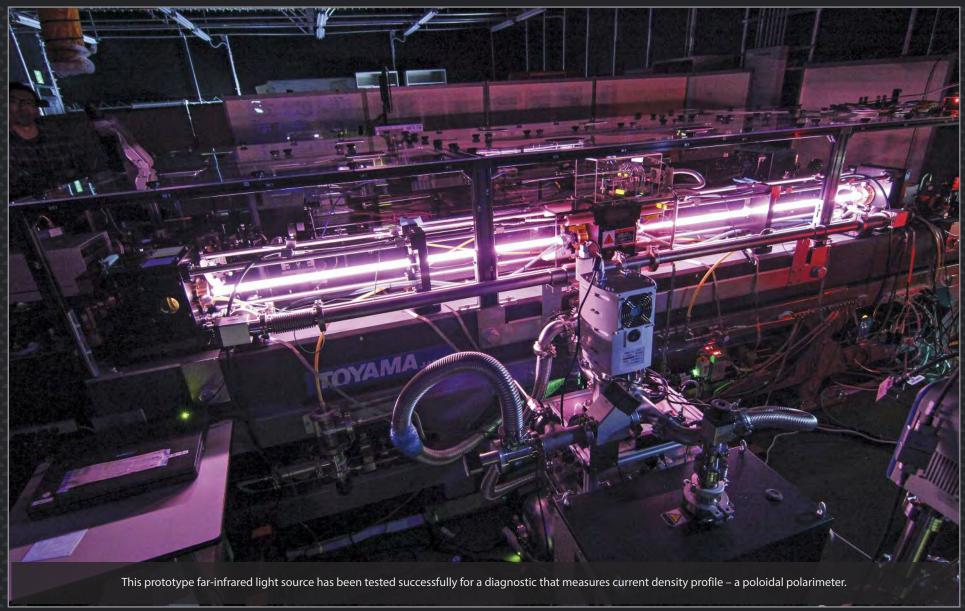

The toroidal field coil05 coil structure composed of four large parts was delivered from Japan to the European Union successfully. All parts passed the handover test without any damage.

Prototype diagnostic

Completion of DC 1.2 megavolt, 3600 s insulation test for Japan Domestic Agency share of the Neutral Beam Test Facility 1 megavolt power supply

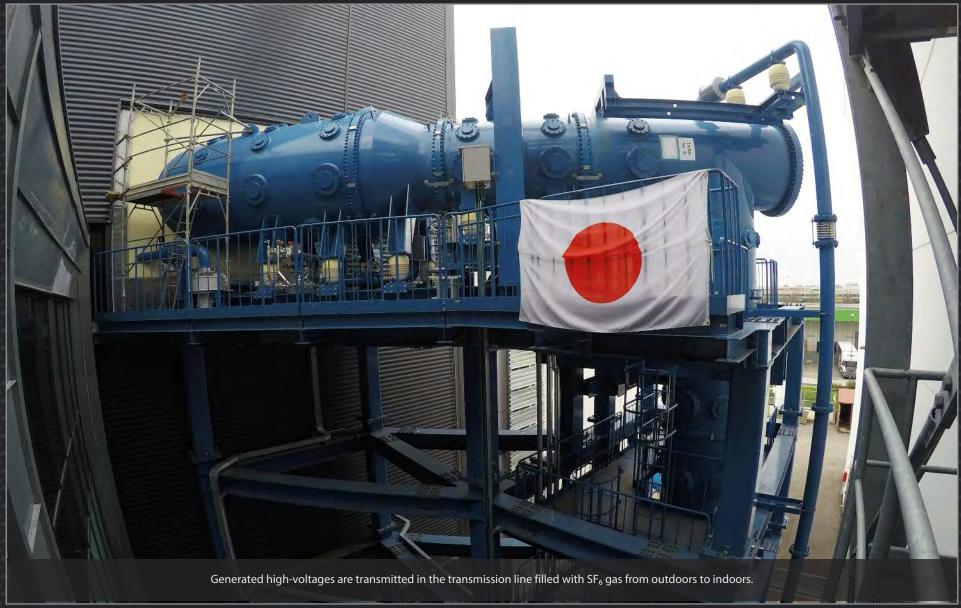

Transmission line for DC 1 megavolt power supply (for MITICA) at the Neutral Beam Test Facility

DC generators for DC 1 megavolt power supply (for MITICA) at the Neutral Beam Test Facility located in Padova, Italy

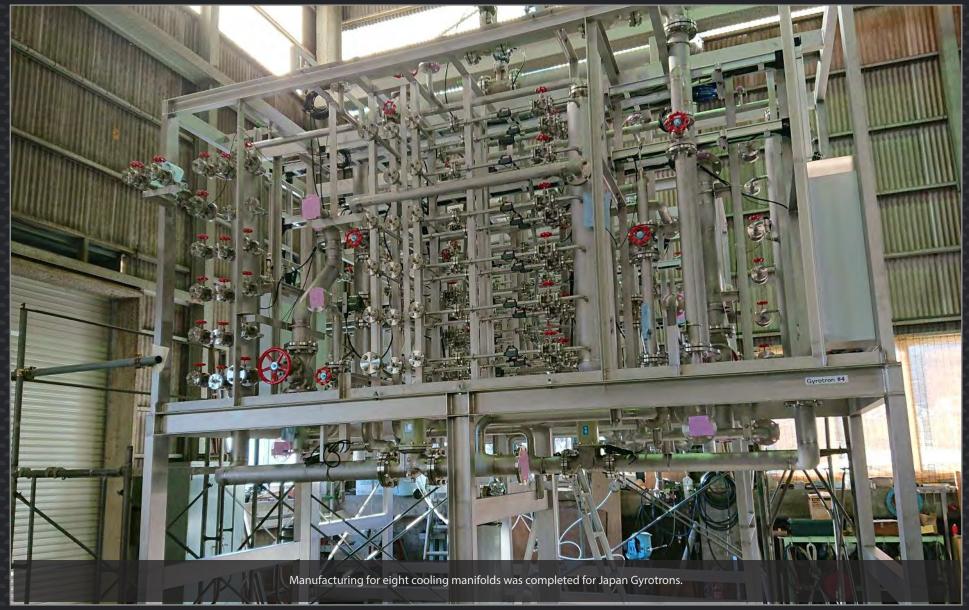

Five DC generators (transformer and rectifier) producing DC 200 kilovolts each are connected in series to generate DC 1 megavolt for negative ion beam acceleration.

Cooling manifold for Japan Gyrotrons

ITER Japan Gyrotrons #3 and #4

Four out of nine

Hyundai Heavy Industries is manufacturing four of ITER's nine vacuum vessel sectors. The first to come off the production line in 2019 will be Sector #6. (Pictured, technicians are inserting in-wall shielding blocks into one of four Sector #6 segments.)

Like clockwork

The first 23 panels of the vacuum vessel thermal shield have been successfully pre-assembled for fitting tests. After silver coating, the panels will be shipped to ITER to be installed on the first vacuum vessel sector.

Solid feet

Korea is procuring a large array of assembly tooling ranging from the tall (see page 24) to the very small. These units will support vacuum vessel sectors and magnet coils from below while they are pre-assembled at ITER.

High-tech power cables

Russia is procuring 5.4 km (500 tonnes) of high-current, water-cooled busbars for the superconducting magnets; the largest will carry close to 70 kiloamps of current.

Port extensions

Extending out from the openings in the vacuum vessel are port stub extensions that must be welded to the sectors before the assembly of the main vessel in the pit. Series production is underway.

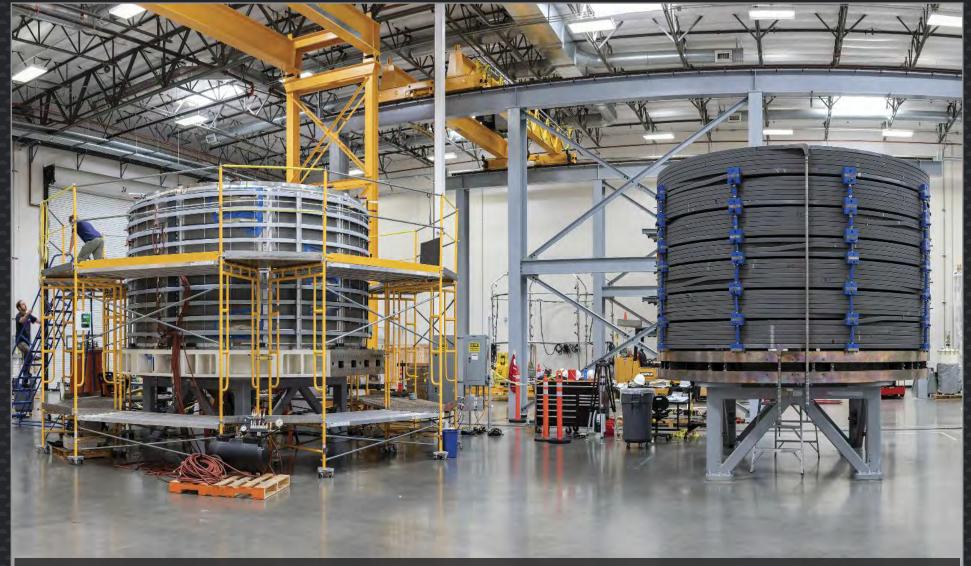

Completely wound

Central solenoid modules at different stages

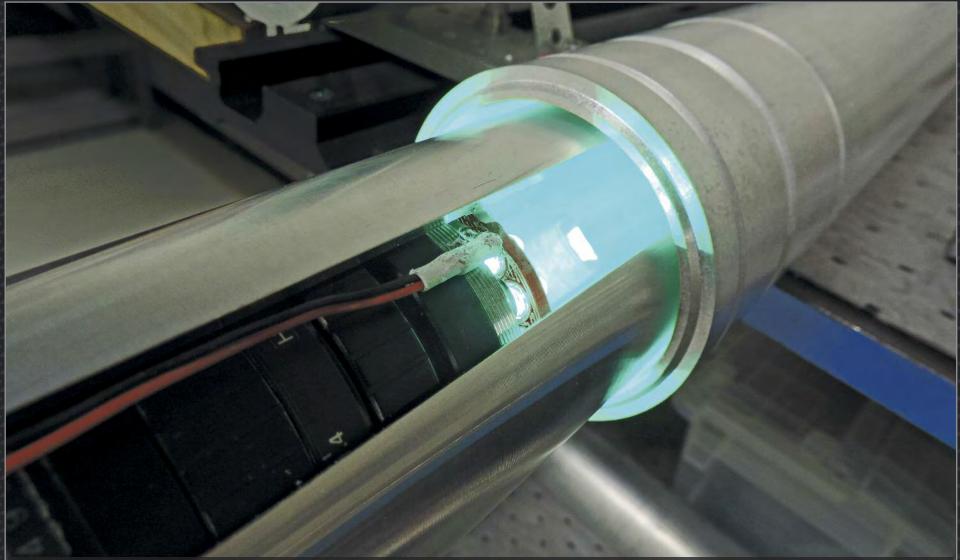

In the General Atomics workshop, one central solenoid module is about to undergo vacuum pressure impregnation (left) and another has been successfully heat treated.

Quality assurance

US ITER is procuring the transmission lines that will provide efficient power transfer from the ion and electron cyclotron wave sources to the plasma. This waveguide inspection camera has been developed to assist manufacturing quality assurance.

Layer upon layer

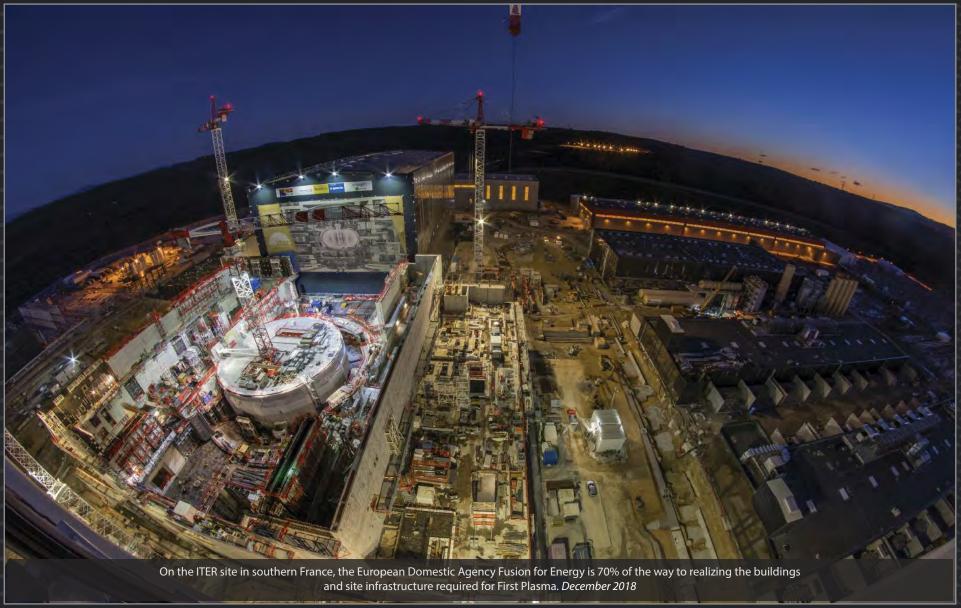

A central solenoid mockup coil was produced to confirm the readiness of all manufacturing steps. One wedge of the mockup, showing layer upon layer of niobium-tin superconductor, is on its way to ITER for future display.

ITER ORGANIZATION **HIGHLIGHTS**

he ITER Project has begun its countdown to First Plasma – only seven years remain until the button is pushed to initiate the first operational event of the ITER scientific program.

Until then, many complex challenges lie ahead as construction is concluded on site, major one-of-a-kind components are finalized and delivered by the Domestic Agencies, and the ITER Organization team plus contractors implement a carefully sequenced assembly, installation and commissioning program.

Based on the stringent metrics that measure overall project performance, 60 percent of the "total construction work scope through First Plasma" (a category that includes all design work; construction and manufacturing; delivery; assembly, installation and commissioning) was completed at the end of 2018.

First Plasma will be a decisive step in the making of the man-made star that will demonstrate that fusion energy can produce power on an industrial scale.

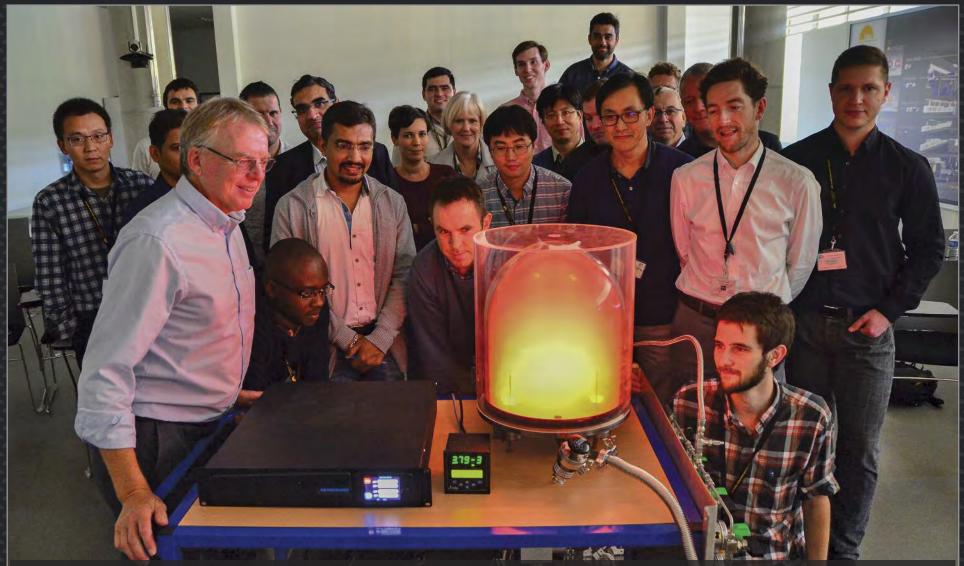

Where are we at?

The ITER Project Control Office tracks progress monthly against the schedule. "At any moment, we can answer the question of where we stand in regard to the objective of First Plasma in 2025," says Deputy Head Colette Ricketts.

The light in the vacuum

Because an unsealed area the width of a human hair is enough to perturb the high vacuum in ITER and halt fusion performance, the vacuum team hosts regular workshops on the fundamentals of vacuum technology.

On the record

Media teams from the seven Members are invited for an annual project update - the perfect occasion to film on site, interview specialists, and learn more about the world's largest collaborative effort in science.

Always a hit

Mr Secretary, Ms Ambassador

A princess with a passion for science

A large delegation of scientists, diplomats and high-level officials from Thailand, including Her Royal Highness Maha Chakri Sirindhorn, travel to ITER for the signature of a Cooperation Agreement with the Thailand Institute of Nuclear Technology.

Witnessing the birth of a star

When asked why he chose to visit the ITER construction site, Microsoft co-founder Paul Allen replied, "A visit to ITER was my chance to see preparations for the birth of a star on Earth."

Team work, just like at ITER

Six hundred students take part in the annual ITER Robots challenge, competing with Lego robots that they have designed and programmed to perform ITER-like remote handling tasks.
